RAM OVERVIEW

“**RAM**”

RAM (Random Access Memory), is the “**short-term memory**” of the computer.
RAM capacity measured in **GB**.

RAM is a **temporary** storage device.
More RAM means **more capacity** to enhance system performance.

RAM is **volatile memory**, which means contents are erased when the computer is turned off.

10 MIN

What does RAM do for computer?

Helps boot up
your computer

Responsible for
holding data while
the applications is
running

Provide the
quickly access to
data that CPU
need for
processing

More RAM allow
you to access
multiple programs
at a time

Finds out how much RAM you have

The screenshot shows the Windows Settings application. The left sidebar contains the following options: Settings (1), Home, Find a setting, System (2), Storage, Tablet, Multitasking, Projecting to this PC, Shared experiences, Clipboard, Remote Desktop, and About (3). The main pane displays the 'About' section. Under 'Device specifications', the 'Installed RAM' is highlighted with a red box and labeled with a blue circle containing the number 4. The value shown is 16.0 GB (15.8 GB usable). Other specifications include: Device name (NYCLT1JCOHEN), Full device name (NYCLT1JCOHEN.ziffdavis.local), Processor (Intel(R) Core(TM) i5-7300U CPU @ 2.60GHz 2.71 GHz), Device ID (BBB51363-8A09-48BC-8309-108502E2D6C9), Product ID (00330-51015-75831-AAOEM), System type (64-bit operating system, x64-based processor), and Pen and touch (No pen or touch input is available for this display). Buttons for 'Copy' and 'Rename this PC' are visible at the bottom.

RAM Module consist of...

Note: **RAM Module** is a board that holds RAM chips used for easy installation and removal from motherboard.

Type of RAM Modules

The common architecture of memory module:

- **Desktop** use **DIMM** (Dual in-line memory module)
- **Laptop** use **SODIMM** (Small Outline DIMMs)

DIMM

SODIMM

DIMM RAM Modules

Short for Dual In-line Memory Module (DIMM) is a module containing a circuit board and one more random access memory chips. DIMM holds SDRAM chip such as DDR DDR2 DDR3 and DDR4 ...

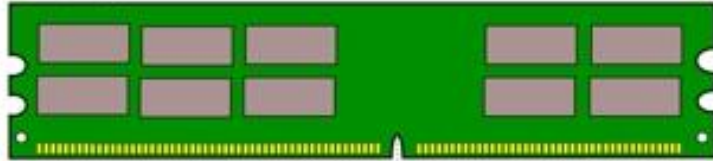

DIMM module had 168-pins which can transfer 64 bits of data at a time and can support with 64-bits CPU type.

168-pins SDRAM DIMM

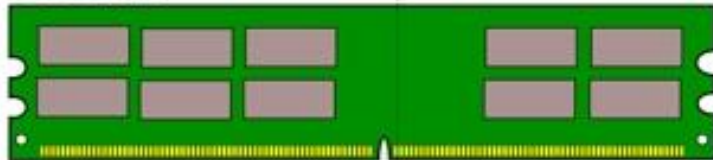

DIMM Memory Modules types

DDR

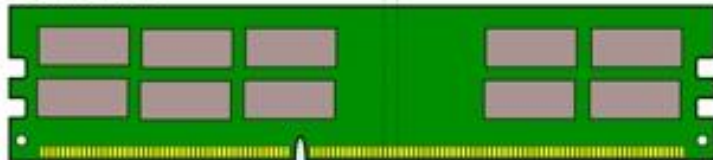

DDR (DIMM) 184-pins

DDR 2

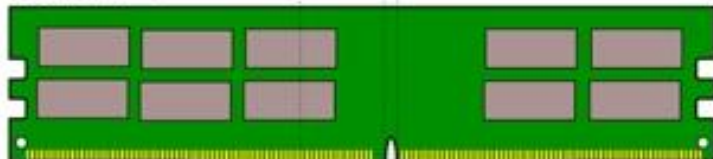

DDR2 (DIMM) 240-pins

DDR 3

DDR3 (DIMM) 240-pins

DDR 4

DDR4 (DIMM) 288-pins

SO-DIMM Memory Modules

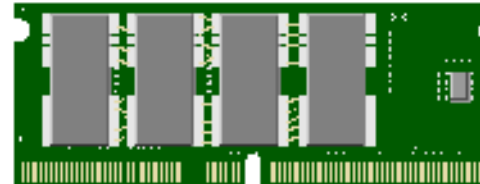

SO-DIMM, which is short for **Small Outline DIMM**. SO-DIMMs are commonly utilized in **laptop** computers. Below is an example picture of a 4GB SODIMM memory stick from Crucial.

Crucial 4GB SODIMM

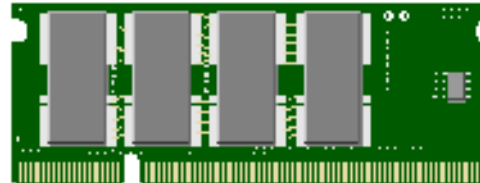

SODIMM MODULES

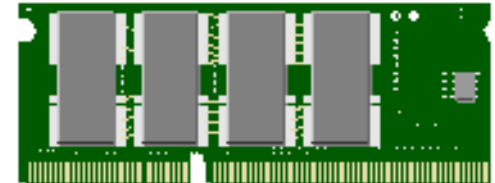

DDR4 - 256-pin SODIMM

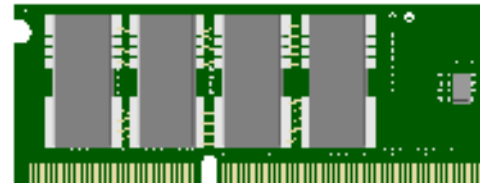

DDR and DDR2 - 200-pin SODIMM

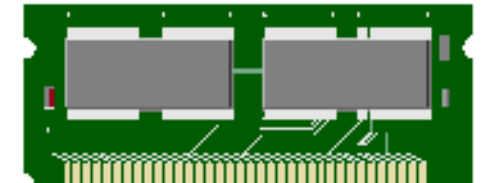

DDR3 - 204-pin SODIMM

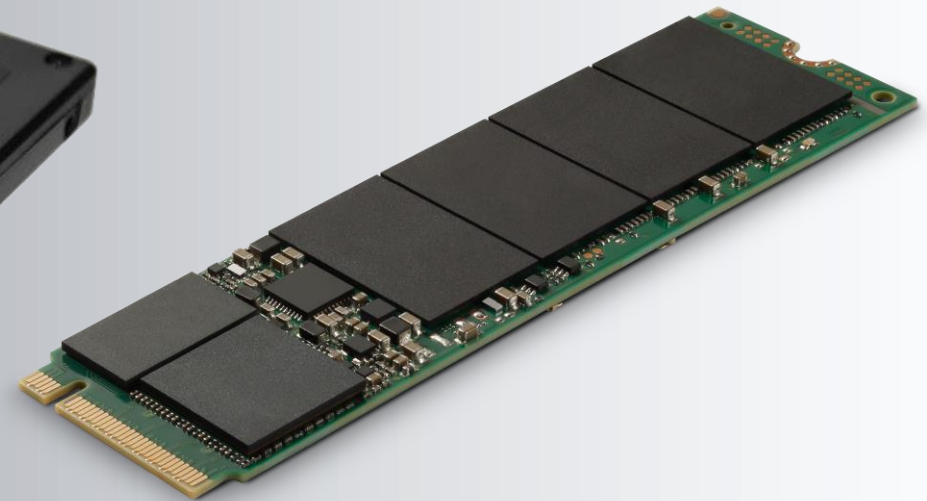

SDRAM, FPM, EDO - 144-pin SODIMM

FPM, EDO - 72-pin SODIMM

Hard Disk

Type of Storage device in computer

There are **two type**
of hard drive

**Hard Disk Drive
(HDD)**

**Solid State Drive
(SSD)**

2 MIN

OVERVIEW of STORAGE DEVICE

Storage device is a non-volatile memory hardware device that permanently *stores* and *retrieves* data on a computer.

The Operating system, software, and data files are stored in HDD/SSD.

HDD/SSD capacity measured in GB

HDD/SSD is a main storage device in computer

Store information even after computer is turned off

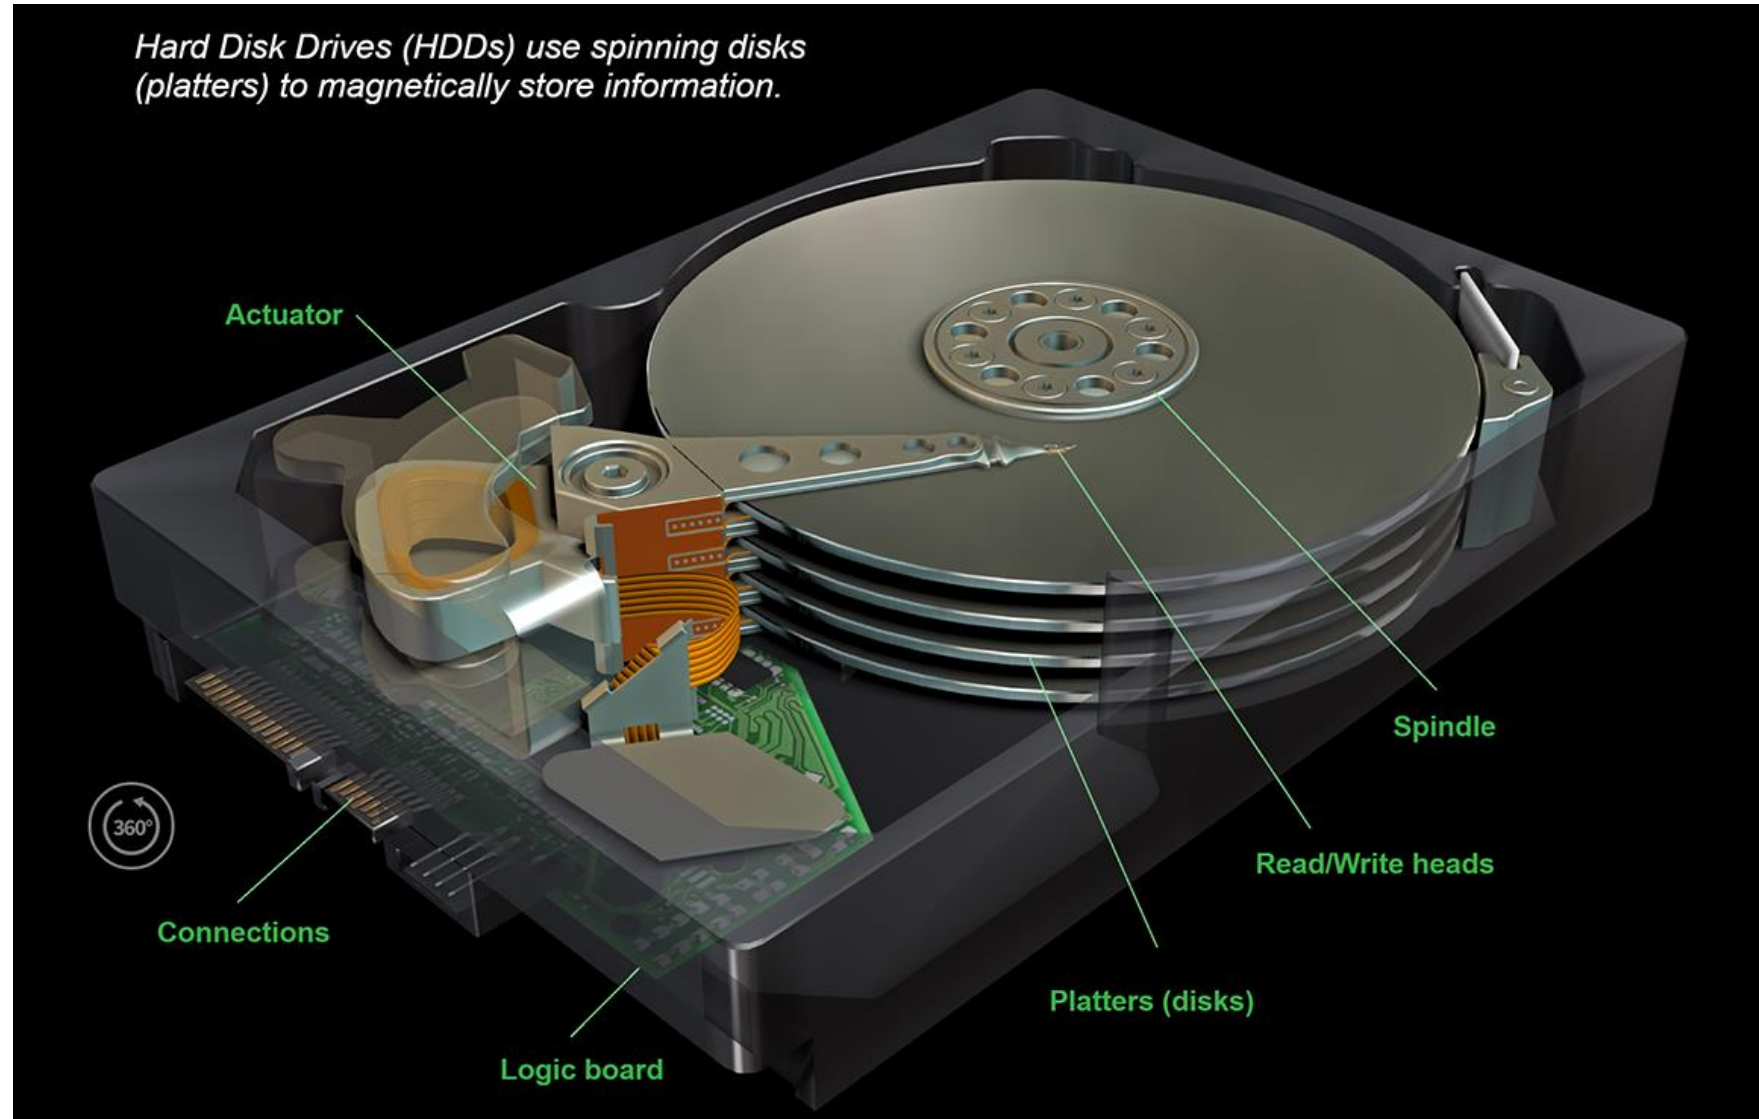

5 MIN

Hard disk use magnetic *heads* on *actuator* arms controlled by a motor to read/write data from the *platters*. Two heads per platter. HDD write data on the platter in binary format **1** or **0**.

Hard Disk Drive (HDD)

Hard Disk Drives (HDDs) use spinning disks (platters) to magnetically store information.

2 MIN

HDD Interfaces Connection

Common drive interfaces are:

- Parallel ATA (**PATA**)
 - Integrated Drive Electronics (**IDE**)
 - Enhanced Integrated Drive Electronics (**EIDE**)
- Serial ATA (**SATA**) and External SATA (**eSATA**)
- Small Computer System Interface (**SCSI**)

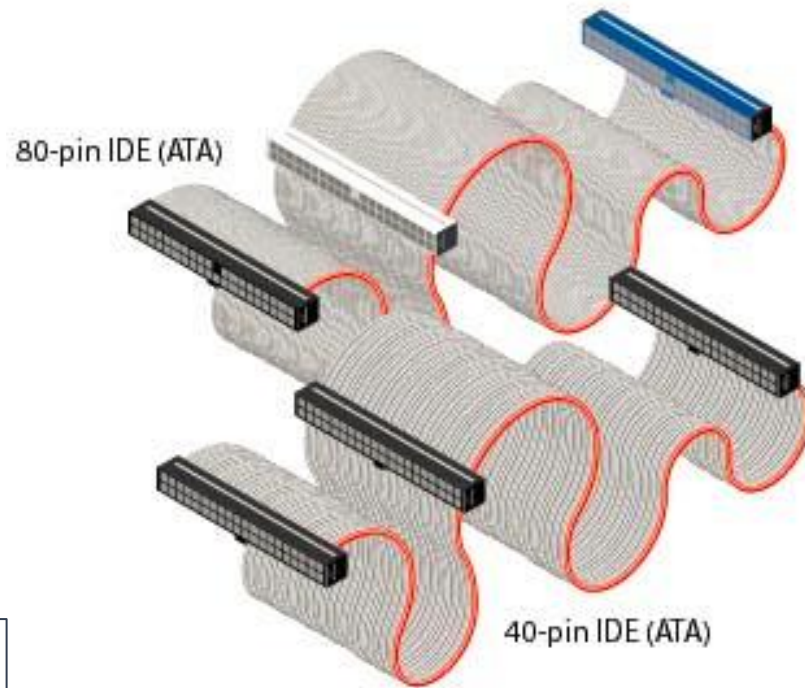

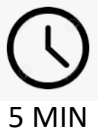

2 MIN

HDD Cable Connector

Solid State Drive

Short for **Solid-State Drive** or **Solid-State Disk**, **SSD** is a new generation of storage device used in a computers. SSD store data using **NAND flash memory** chip.

Unlike a hard drive, an SSD has no moving parts, which gives it advantages such as accessing stored information **faster**, **no noise**, often more **reliable**, and consuming **less power**.

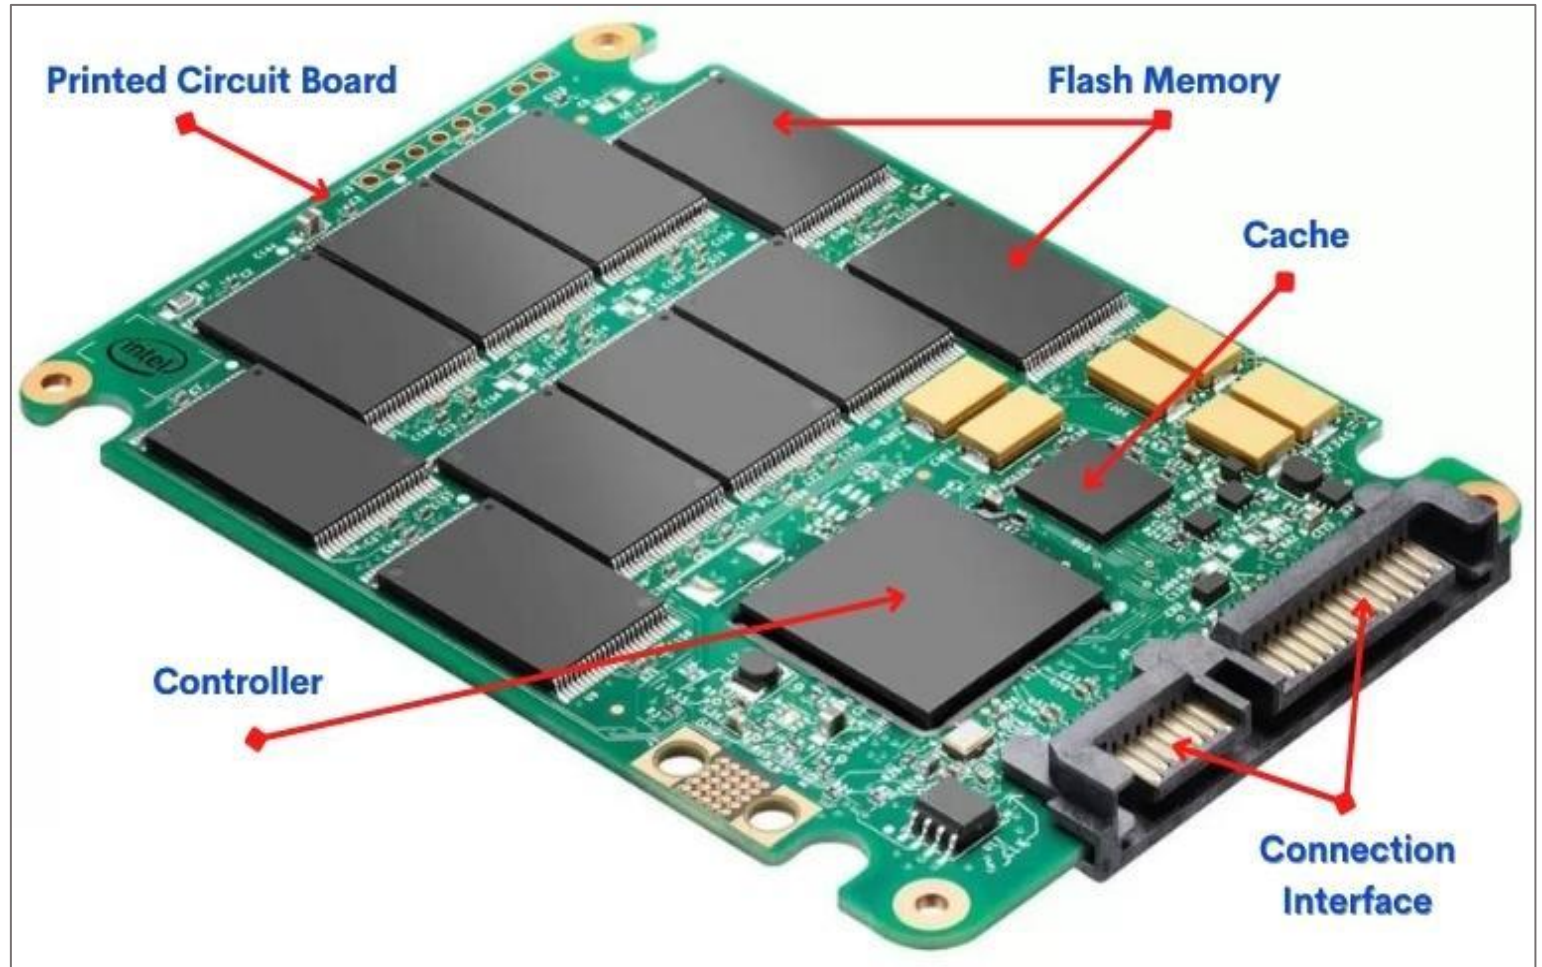

5 MIN

How SSD Work?

1. The **Flash Memory** is responsible for storing data (non-volatile memory NAND memory chip).
2. The **Controller** is responsible for how data gets stored in a flash memory.
3. The **Cache** is used to improve the performance of SSD.
4. The **Connection interface** is a physical connector for interaction of SSD controller with the motherboard. (SATA, PCIe)

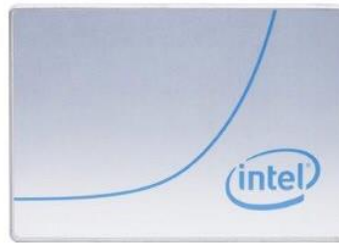

Different Type of SSD

Types of SSD

SATA 2.5"

U.2

M.2 SATA

M.2 NVMe

PCIe

HDD vs SSD

5 MIN

Advantages of SSD over HDD

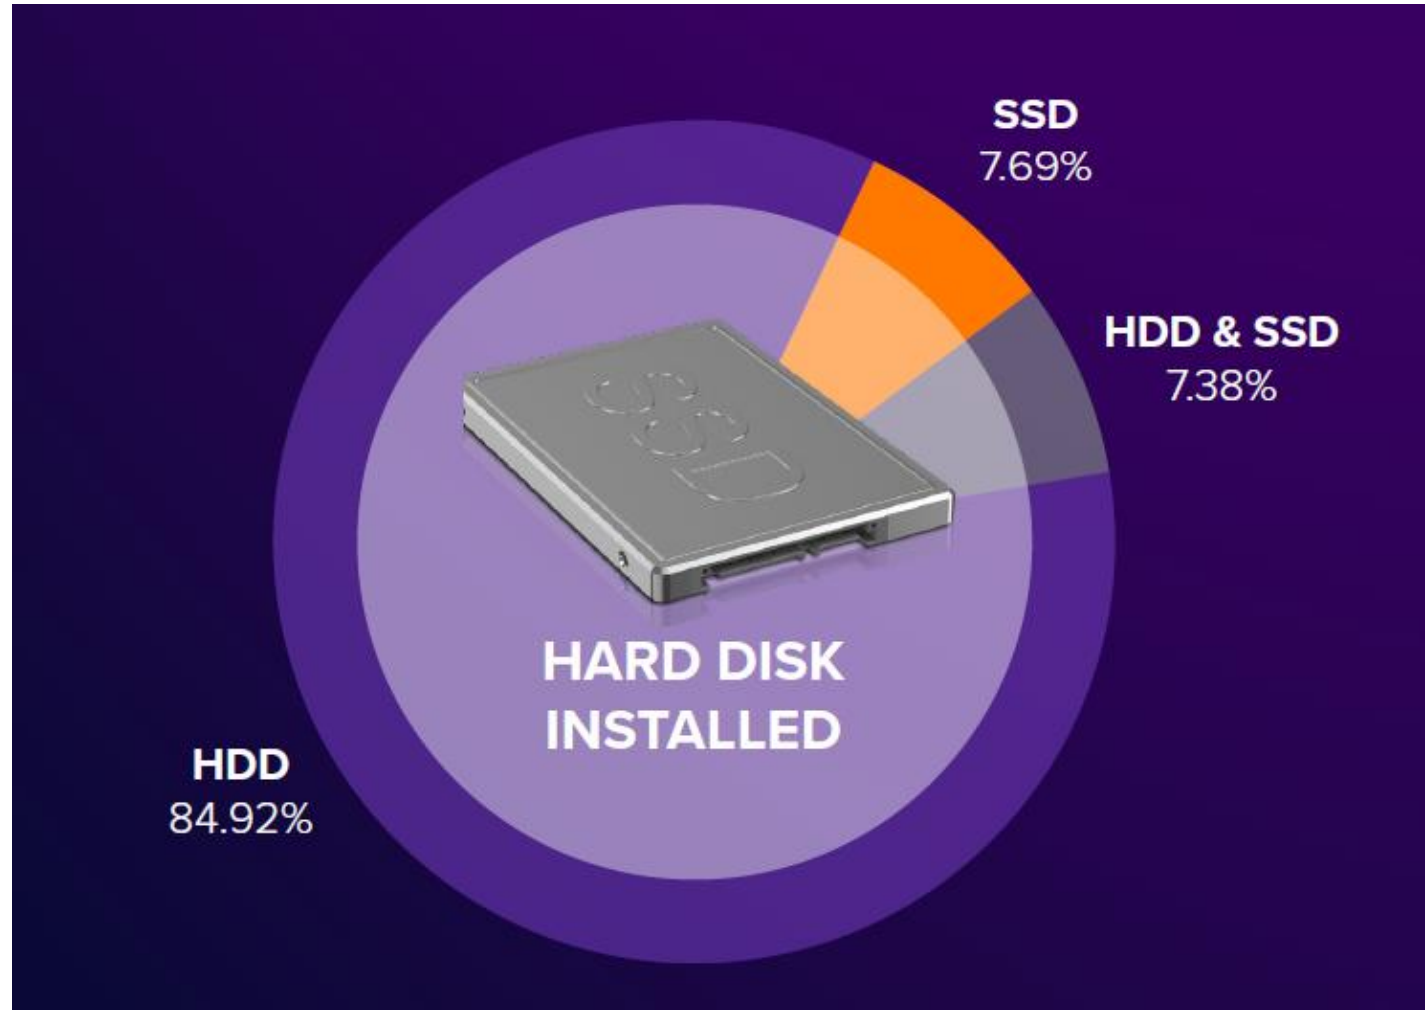

SSD has advantages over HDD:

- **Access time:** speed to access data faster than HDD (2 or 3 times)
- **Reliability:** has no moving parts, it use flash memory to store data.
- **Power:** uses less power than a standard HDD
- **Noise:** With no moving parts SSD generates no noise
- **Size:** SSD is available in 2.5", 1.8" and 1.0" – smaller and lightweight
- **Heat:** generate less heat, helping to increase its lifespan

But, SSDs aren't as popular as you might think?
